## TECHNICAL SKILLS

HTML, CSS, JavaScript, jQuery, React, AJAX, Git, Lodash, Chart.js, Less, Sass, Bootstrap, RESTful API Services, Responsive Design, CMS Systems, GraphQL, SEO, Leaflet, Template Toolkit, Underscore, Redux, React Hooks

## EMPLOYMENT HISTORY

### Front End Developer

ZipRecruiter | 2018 - 2020

I worked on the marketplace tools, publisher side of the business, redesigned employer products, and started focusing on Enterprise customers.

- Built reusable React components that were used on the Enterprise dashboards for displaying campaign and job performance
- Designed an in-house DatePicker component to be used for our internal reporting and customer facing marketplace dashboards
- Created custom line and bar charts using Chart.js to mimic key performance indicator panels showing customers their data quickly and visually
- Refactored our ATS by removing class based components and updated using hooks, while decoupling the fetching of data for reusability
- Engineered a new employer dashboard, using React and Redux, by taking all of our links and turning them into fully functioning widgets
- Architected admin and employer insights, a place to gather high level information, consisting of charts, maps, and table React components
- Produced a search quality portal using Lodash, a single page application allowing admins to rate jobs which we could later compare to our AI
- Helped our ESM's by creating our audience estimator page, reusing insights components but adding the ability to search for a job by location
- Developed our Publisher Self Serve, a SPA form flow allowing users to setup an account without the need of contacting an admin
- Using Lodash and vanilla javascript, built a fully filterable search for admins that queries the entire site, from orgs to accounts and users
- Updated the admin notes component to be a single page application, giving users the ability to filter, search, and view all of a campaign's history
- With React, built a reusable component to bulk edit campaigns, as well as review and update them if needed

### Jr. Front End Developer

ZipRecruiter | 2016 - 2018

I was hired to redesign and architect the user interface for the marketplace, giving administrators an easier workflow

- Designed and re-skinned 6 pages, and made decisions based on the data received from our backend at the time
- Created reusable custom data tables by constructing algorithm's to handle, update, and export a user's data and display it in a friendlier way
- Re-skinned every external widget, and created new widgets for publishers to put on their websites
- Developed a WYSIWYG, a tool that would show a user's changes to a widget and then spit out the CSS and api request required to retrieve it

### Hacker In Residence

HackReactor | 2015 - 2016

I was brought on after being a student for a 3 month contract gig to help current students complete the course training

- Conducted technical interviews and precourse check-in interviews to gauge valuable applicants
- Helped students debug errors in their code and provided technical mentoring
- Gave lightning talks on subjects I was passionate about after class to those interested in learning more

## EDUCATION

### Hack Reactor

Advanced immersive software engineering program | 2015

### California Polytechnic State University, San Luis Obispo

Bachelor of Science in Graphic Communications - Web and Digital Media concentration
